

USER!2019

RJDemetra: an R interface to JDemetra+

ALAIN QUARTIER-LA-TENTE

Insee, Seasonal Adjustment Centre of Excellence

alain.quartier-la-tente@insee.fr

Sommaire

1. Introduction to seasonal adjustment

2. RJDemetra

3. Around RJDemetra and JDemetra+

4. Installation and future developments

Introduction to seasonal adjustment (1/3)

Introduction to seasonal adjustment (2/3)

Weekday	Average CRAN downloads
Monday	14628
Tuesday	15941
Wednesday	15706
Thursday	15206
Friday	12948
Saturday	7038
Sunday	7104

Table 1: Average of CRAN downloads of ggplot2 per weekday since 2015

Introduction to seasonal adjustment (3/3)

Purpose of seasonal adjustment:

- Time comparison (outlook, short-term evolution...)
- Spatial comparison

Introduction to seasonal adjustment (3/3)

Purpose of seasonal adjustment:

- Time comparison (outlook, short-term evolution...)
- Spatial comparison

Two leading methods:

- TRAMO/SEATS+ (Bank of Spain)
- X-12ARIMA/X-13ARIMA-SEATS (US-Census Bureau).

Introduction to seasonal adjustment (3/3)

Purpose of seasonal adjustment:

- Time comparison (outlook, short-term evolution...)
- Spatial comparison

Two leading methods:

- TRAMO/SEATS+ (Bank of Spain)
- X-12ARIMA/X-13ARIMA-SEATS (US-Census Bureau).

→ proceed in two steps:

1. Pre-adjusting the series of deterministic effects with a RegARIMA model
2. Decomposition: to extract seasonal component

What's JDemetra+?

TRAMO/SEATS+ and X-13ARIMA-SEATS are implemented in JDemetra+ (JD+)

👍 Software officially recommended by Eurostat and the ECB for seasonal and calendar adjustment of official statistics

→ RJDemetra is an  interface to JDemetra+ based on the  libraries of JD+

Sommaire

1. Introduction to seasonal adjustment

2. RJDemetra

2.1 Current status

2.2 RegARIMA examples

2.3 Seasonal adjustment examples

2.4 Export a JD+ workspace

2.5 Import a JD+ workspace

2.6 Reduce time computation

3. Around RJDemetra and JDemetra+

4. Installation and future developments

Current status

- RegARIMA, TRAMO-SEATS and X-13-ARIMA:
 - pre-defined and user-defined specifications: outliers detection, ARIMA detection, userdefined regressors, transformation function. . .
 - S3 classes with plot, summary, print methods
- Manipulate JD+ workspaces:
 - Import JD+ workspace to get input raw series or SA model
 - Export R models created via RJDemetra
- Include a dataset: industrial production indices in manufacturing in the European Union

Object structure

A SA object is a `list()` of 5 elements:

```
SA
├─ regarima (≠ X-13 and TRAMO-SEAT)
│  └─ specification
│     └─ ...
├─ decomposition (≠ X-13 and TRAMO-SEAT)
│  └─ specification
│     └─ ...
├─ final
│  └─ series
│     └─ forecasts
├─ diagnostics
│  └─ variance_decomposition
│  └─ combined_test
│     └─ ...
└─ user_defined
```

Create your first model

Like in JD+ users can defined their own specification or use a pre-defined one:

```
library(RJDemetra)
ipi_fr <- ipi_c_eu[, "FR"]
ts_mod <- tramoseats(ipi_fr, spec = "RSAfull")
x13_usr_spec <- x13_spec(spec = c("RSA5c"),
                        usrdef.outliersEnabled = TRUE,
                        usrdef.outliersType = c("LS", "AO"),
                        usrdef.outliersDate = c("2008-10-01",
                                                "2002-01-01"),
                        usrdef.outliersCoef = c(36, 14),
                        transform.function = "None")
x13_mod <- x13(ipi_fr, x13_usr_spec, userdefined = "diagnostics.ic-ratio")
```

Use `user_defined_variables()` to get the names of the user-defined variables

RegARIMA examples (1/2)

```
summary(x13_mod$regarima)
```

```
## y = regression model + arima (0, 1, 1, 0, 1, 1)
##
## Model: RegARIMA - X13
## Estimation span: from 1-1990 to 12-2017
## Log-transformation: no
## Regression model: no mean, no trading days effect, no leap year effect, Easter
##
## Coefficients:
## ARIMA:
##           Estimate Std. Error T-stat Pr(>|t|)
## Theta(1) -0.53675    0.04770 -11.25  <2e-16 ***
## BTheta(1) -0.50830    0.04961 -10.25  <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Regression model:
##           Estimate Std. Error T-stat Pr(>|t|)
## Easter [1]   -1.1686    0.3385  -3.452 0.000629 ***
## AO (9-2008)   31.4099    2.1812  14.400 < 2e-16 ***

## Others           61.971
## Total           103.128
##
## Combined test in the entire series
## Non parametric tests for stable seasonality
##
##                                     P.value
## Kruskal-Wallis test                  0.000
## Test for the presence of seasonality assuming stability 0.000
## Evolutive seasonality test           0.032
##
## Identifiable seasonality present
##
```

Export a workspace

```
wk <- new_workspace()
new_multiprocessing(wk, name = "MP-1")
add_sa_item(wk, multiprocessing = "MP-1",
            sa_obj = x13_mod, name = "SA with X13 model 1 ")
add_sa_item(wk, multiprocessing = "MP-1",
            sa_obj = ts_mod, name = "SA with TramoSeats model 1")
save_workspace(wk, "workspace.xml")
```

The screenshot displays the RJDemetra application window. On the left, a 'Workspace' tree shows the project structure: 'workspace' (containing 'Modelling', 'Seasonal adjustment', 'Specifications', 'Documents', 'Multi-documents', 'MP-1', 'Utilities', 'Calendars', and 'Variables'). The 'MP-1' project is selected, showing a table of seasonal adjustment models.

Series	Method	Estimation	Status	Priority	Quality	Warnings	Comments
SA with X13 model 1	X13		Valid		Good		
SA with TramoSeats model 1	TS		Valid		Severe		

The 'SA with X13 model 1' model is selected, and its details are shown in the right pane. The details include the model name, a link to 'Pre-processing (ReqArima)', and a 'Summary' section.

SA with X13 model 1

[Pre-processing \(ReqArima\)](#)

Summary

Estimation span: [1-1990 - 12-2017]
 336 observations
 No trading days effects
 No easter effect
 7 detected outliers
 2 fixed outliers

Import a workspace

```
wk <- load_workspace("workspace.xml")
compute(wk) # Important to get the Sa model
models <- get_model(wk, progress_bar = FALSE) # get all models
# Or to get one specific model:
mp <- get_object(wk, 1)
count(mp)
```

```
## [1] 2
```

```
sa2 <- get_object(mp, 2)
get_name(sa2)
```

```
## [1] "SA with TramoSeats model 1"
```

```
mod <- get_model(sa2, wk)
```

Manipulate ☕ objects (1/2)

Default functions can be time consuming (computation of outputs)... Especially if you only need one specific parameter

→ “Manipulate” java models: `jx13`, `jtramoseats`, `jregarima`, `jregarima_x13`, `jregarima_tramoseats` and `get_jmodel`

```
jx13_mod <- jx13(ipi_fr, x13_usr_spec)
# To get the available outputs:
tail(get_dictionary(jx13_mod), 2)
```

```
## [1] "diagnostics.msr-global" "diagnostics.msr(*)"
# To get an indicator:
get_indicators(jx13_mod, "diagnostics.ic-ratio")
```

```
## $`diagnostics.ic-ratio`
## [1] 4.356533
# To get the previous R output
x13_mod <- jSA2R(jx13_mod)
```

→ The output can be customize by every user/institute

Sommaire

1. Introduction to seasonal adjustment

2. RJDemetra

3. Around RJDemetra and JDemetra+

3.1 Around RJDemetra

3.2 Around JDemetra+

4. Installation and future developments

Examples of current use of RJDemetra

- ggdemetra: ggplot2 extension for 'RJDemetra'

 <https://github.com/AQLT/rjdqa>

- rjdqa: package to help quality assessment (dashboard and quality report matrix)

 <https://github.com/AQLT/rjdqa>

- persephone: enable easy processing during production of SA series (interactive plots, dashboards. . .)

 <https://github.com/statistikat/persephone>

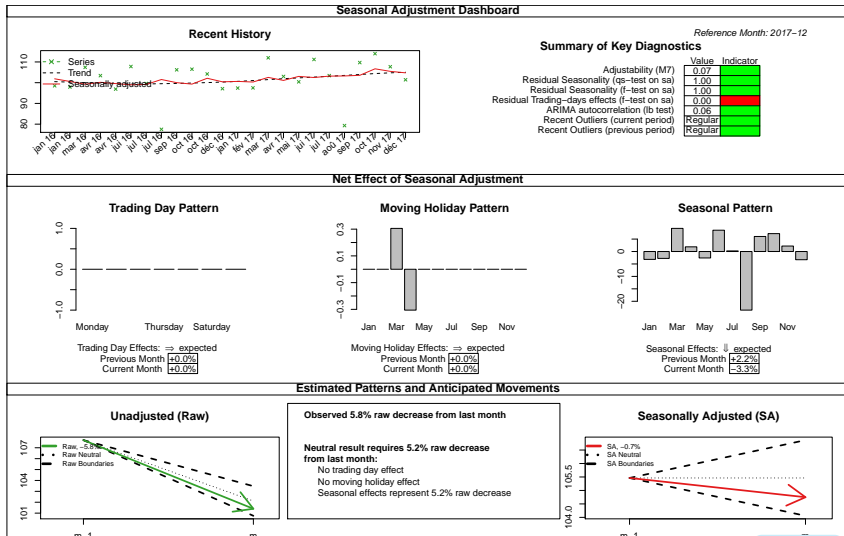

- rjdmarkown: nice rmarkdown outputs for RJDemetra

 <https://github.com/AQLT/rjdmarkdown>

- Carry out studies on SA: Ladiray D., Quartier-la-Tente A., “(In)Stability of Reg-ARIMA Models for Seasonal Adjustment”

rjdqa

```
plot(rjdqa::sa_dashboard(x13_mod))
```

ggdemetra

Around JDemetra+

- State space framework of JD+:
 <https://github.com/nbbird/rjdssf>
- Benchmarking and temporal disaggregation:
 <https://github.com/palatej/rjdbench>
- R interface to the JWSACruncher (console tool to refresh the models of a JD+ workspace):
 <https://github.com/AQLT/rjwsacruncher>

Sommaire

1. Introduction to seasonal adjustment

2. RJDemetra

3. Around RJDemetra and JDemetra+

4. Installation and future developments

4.1 How to install the package?

4.2 Why use RJDemetra?

4.3 Future developments

How to install the package?

The package is available on : <https://github.com/jdemetra/rjdemetra>

It has also its own website: <https://jdemetra.github.io/rjdemetra/>

Cran release

```
install.packages("RJDemetra")
```

Development version

```
devtools::install_github("jdemetra/rjdemetra")
```

To install it you need Java8: in case you don't, install a portable version of Java8 and set the JAVA_HOME path.

See the installation manual:

<https://github.com/jdemetra/rjdemetra/wiki/Installation-manual>

Why use RJDemetra ?

- Methods used are recommended by Eurostat
- Performance and integration in production with JDemetra+
- Lots of  developments around RJDemetra
- RJDemetra evolves with JDemetra+: will integrate new developments on SA methods

What's next?

- documentation: article for the Journal of Statistical Software + cheat sheet
- shiny app to change the specification

With JD+ 3.0.0 (by the end of 2020):

- Function to “refresh” the model
- Compatibility with all frequencies (JD+ daily, weekly, etc.)

Thank you for your attention...

... And don't forget your stickers!
