R and JDemetra+ 3.0: A new toolbox around seasonal adjustment and time series analysis

ALAIN QUARTIER-LA-TENTE Insee Session 10: Seasonal and Calendar Adjustment Friday 23 September 2022

Contents

- 1. Introduction
- 2. Utility packages
- 3. Seasonal adjustment packages
- 4. Other packages
- 5. Conclusion

Introduction (1)

- In March 2019, RJDemetra was published on CRAN:
 - first R package that enables to use TRAMO-SEATS
 - o faster than existing R packages on seasonal adjustment
 - enables to interact with JDemetra+ "workspaces" used in production

Introduction (1)

- In March 2019, RJDemetra was published on CRAN:
 - first R package that enables to use TRAMO-SEATS
 - o faster than existing R packages on seasonal adjustment
 - o enables to interact with JDemetra+ "workspaces" used in production
- With the development of JDemetra+ 3.0, more than 12 R packages are being developed! Not only on seasonal adjustment!

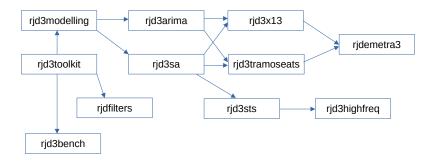

Introduction (2)

They are all available in GitHub and require Java ≥ 17 (see for example installation manual of RJDemetra:

https://github.com/jdemetra/rjdemetra/wiki/Installation-manual):

```
# install.packages("remotes")
remotes::install_github("palatej/rjd3toolkit")
remotes::install_github("palatej/rjd3modelling")
remotes::install_github("palatej/rjd3sa")
remotes::install_github("palatej/rjd3arima")
remotes::install_github("palatej/rjd3x13")
remotes::install_github("palatej/rjd3tramoseats")
remotes::install_github("palatej/rjdemetra3")
remotes::install_github("palatej/rjdfilters")
remotes::install_github("palatej/rjd3sts")
remotes::install_github("palatej/rjd3highfreq")
remotes::install github("palatej/rjd3bench")
remotes::install github("AQLT/ggdemetra3")
```

Introduction (3)

If you don't know what to do: install all of them!

Contents

- 1. Introduction
- 2. Utility packages
- 2.1 rjd3toolkit
- 2.2 rjd3modelling
- 2.3 rjd3sa
- 3. Seasonal adjustment packages
- 4. Other packages
- 5. Conclusion

rjd3toolkit

Contains several utility functions used in other rjd packages and several functions to perform tests:

- Normality tests: Bowman-Shenton (bowmanshenton()), Doornik-Hansen (doornikhansen()), Jarque-Bera (jarquebera())
- Runs tests (randomness of data): mean or the median (testofruns()) or up and down runs test (testofupdownruns())
- autocorrelations function (usual, inverse, partial)
- aggregate to aggregate a time serie to a higher frequency

Examples (1)

Value: -0.1150397 ## P-Value: 0.9084

```
library(rjd3toolkit)
set.seed(100)
x = rnorm(1000); y = rlnorm(1000)
bowmanshenton(x) # normal distribution
## Value: 0.3117551
## P-Value: 0.8557
bowmanshenton(y) # log-normal distribution
## Value: 33551.78
## P-Value: 0.0000
testofruns(x) # random data
## Value: 1.396856
## P-Value: 0.1625
testofruns(y) # random data
```

5 / 48

Examples (2)

```
testofruns(1:1000) # non-random data
## Value: -31.57534
## P-Value: 0.0000
autocorrelations(x)

## -0.045255005 -0.021485597 0.028314840
```

rjd3modelling

- create user-defined calendar and trading-days regressors: calendar.new() (create a new calendar), calendar.holiday() (add a specific holiday, e.g. christmas), calendar.easter() (easter related day) and calendar.fixedday()
- create outliers regressors (AO, LS, TC, SO, Ramp, intervention variables), calendar related regressors (stock, leap year, periodic dummies and contrasts, trigonometric variables) -> to be added quadratic ramps
- Range-mean regression test (to choose log transformation), Canova-Hansen (td.ch()) and trading-days f-test (td.f())

Example of a specific calendar (1)

```
library(rjd3modelling)
fr cal <- calendar.new()</pre>
calendar.holiday(fr cal, "NEWYEAR")
calendar.holiday(fr cal, "EASTERMONDAY")
calendar.holiday(fr cal, "MAYDAY")
calendar.fixedday(fr cal, month = 5, day = 8,
                  start = "1953-03-20"
# calendar.holiday(fr_cal, "WHITMONDAY") # Equivalent to:
calendar.easter(fr cal, offset = 61)
calendar.fixedday(fr_cal, month = 7, day = 14)
# calendar.holiday(fr_cal, "ASSUMPTION")
calendar.easter(fr_cal, offset = 61)
calendar.holiday(fr_cal, "ALLSAINTSDAY")
calendar.holiday(fr_cal, "ARMISTICE")
calendar.holiday(fr_cal, "CHRISTMAS")
```

Example of a specific calendar (2)

Use holidays() to get the days of the holidays and htd() to get the trading days regressors

```
holidays(fr_cal, "2020-12-24", 10, single = T)
```

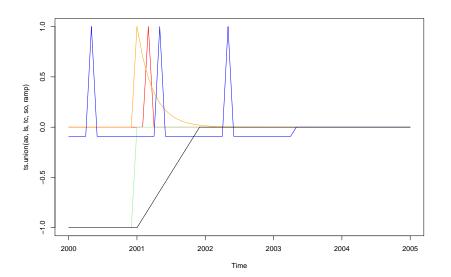

```

```

Example of a specific calendar (3)

```
s = ts(0, start = 2020, end = c(2020, 11), frequency = 12)
# Trading-days regressors (each day has a different effect, sunday as contrasts)
td_reg <- htd(fr_cal, s = s, groups = c(1, 2, 3, 4, 5, 6, 0))
# Working-days regressors (Monday = ... = Friday; Saturday = Sunday = contrasts)
wd_reg <- htd(fr_cal, s = s, groups = c(1, 1, 1, 1, 1, 0, 0))
# Monday = ... = Friday; Saturday; Sunday = contrasts
wd_reg <- htd(fr_cal, s = s, groups = c(1, 1, 1, 1, 1, 2, 0))
wd_reg</pre>
### group-1 group-2
```

Example of outliers (1)

Example of outliers (2)

rjd3sa (1)

Seasonality tests:

- Canova-Hansen (seasonality.canovahansen())
- X-12 combined test (seasonality.combined())
- F-test on seasonal dummies (seasonality.f())
- Friedman Seasonality Test (seasonality.friedman())
- Kruskall-Wallis Seasonality Test (seasonality.kruskalwallis())
- Periodogram Seasonality Test (seasonality.periodogram())
- QS Seasonality Test (seasonality.qs())

rjd3sa (2)

[1] "PRESENT"

\$kruskalwallis

Cleanalealerallia Curalua

##

Always correct the trend and remove the mean before seasonality tests:

```
library(rjd3sa)
y = diff(rjd3toolkit::ABS$X0.2.09.10.M, 1); y = y - mean(y)
seasonality.f(y, 12)
## Value:
           378.9234
## P-Value:
             0.0000
seasonality.friedman(y, 12)
## Value:
           298, 2529
## P-Value: 0.0000
seasonality.kruskalwallis(y, 12)
## Value: 319.9801
## P-Value: 0.0000
seasonality.combined(y, 12)
## $seasonality
```

Contents

- 1. Introduction
- 2. Utility packages
- 3. Seasonal adjustment packages
- 3.1 rjd3arima
- 3.2 rjd3x13
- 3.3 rjd3tramoseats
- 3.4 rjdemetra3
- 3.5 rjdhighfreq
- 4. Other packages

5. Conclusion

rjd3arima

Utility functions used in rjd3x13 and rjd3tramoseats to set the specification of the preprocessing:

```
set_arima(), set_automodel(), set_basic(), set_easter(),
set_estimate(), set_outlier(), set_tradingdays(),
set_transform(), add_outlier() and remove_outlier(), add_ramp()
and remove_ramp()'
```

add_usrdefvar() not yet available

rjd3arima

Utility functions used in rjd3x13 and rjd3tramoseats to set the specification of the preprocessing:

```
set_arima(), set_automodel(), set_basic(), set_easter(),
set_estimate(), set_outlier(), set_tradingdays(),
set_transform(), add_outlier() and remove_outlier(), add_ramp()
and remove_ramp()'
```

Functions commons to RegARIMA and TRAMO

rjd3arima

Utility functions used in rjd3x13 and rjd3tramoseats to set the specification of the preprocessing:

```
set_arima(), set_automodel(), set_basic(), set_easter(),
set_estimate(), set_outlier(), set_tradingdays(),
set_transform(), add_outlier() and remove_outlier(), add_ramp()
and remove_ramp()'
```

Functions commons to RegARIMA and TRAMO

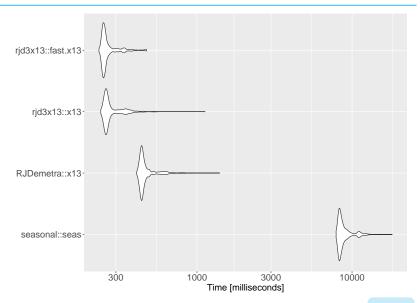

In RJDemetra you have one function to set the specification (regarima_spec_x13(), regarima_spec_tramo(), x13_spec() and tramoseats_spec()) now one function for each part of the specification

rjd3x13

Main functions:

- Specification: created with spec_x11_default(), spec_x13_default(), spec_regarima_default() and customized with rjd3arima functions + set_x11()
- Apply model with x11(), x13(), fast.x13(), regarima(), fast.regarima()
 - -\
 - Refresh policies: regarima.refresh() and x13.refresh()

Performance

Exemple (1)

```
y = rjd3toolkit::ABS$X0.2.09.10.M
spec = spec_x13_default("rsa5c") |> set_easter(type = "unused") |>
  set outlier(outliers.type = c("AO", "LS")) |>
  set_tradingdays(test = "None") |> set_x11(henderson.filter = 13) |>
  add_outlier(type = "TC", date = "2000-06-01",
              name = "My TC in 2000-06")
m = rjd3x13::fast.x13(y, spec)
# m is a list with several outputs:
names(m)
## [1] "preprocessing" "preadjust"
                                        "decomposition"

plot(m)

rjd3tramoseats

Main functions:

- Specification: created with spec_tramoseats_default(),
 spec_tramo_default() and customized with rjd3arima functions + set_seats()
- Apply model with tramoseats(), fast.tramoseats(), tramo(), fast.tramo()
 - -`_
 - Refresh policies: tramo.refresh() and tramoseats.refresh()

Exemple (1)

```
spec = spec_tramoseats_default("rsafull") |>
  set easter(type = "IncludeEasterMonday") |>
  set tradingdays(test = "Separate T") |>
  set seats(algorithm = "KalmanSmoother")
m = rjd3tramoseats::tramoseats(y, spec)

rjdemetra3

Functions to manipulate JDemetra+ workspaces:

- Still in construction: you can load an existing workspace but not create a new one (use jws.load() for example)
- Will contain all the functionalities of rjdworkspace

rjd3highfreq

Seasonal adjustment of high frequency data:

• ractional and multi airline decomposition

- Extension of X-11 decomposition with non integer periodicity
- STL/Loess

See Session 3: High Frequency Data and https://github.com/palatej/test_rjd3hf

Contents

- 1. Introduction
- 2. Utility packages
- 3. Seasonal adjustment packages
- 4. Other packages
- 4.1 rjdfilters
- 4.2 rjd3sts
- 4.3 rjd3bench
- 4.4 ggdemetra3
- 5. Conclusion

rjdfilters (1)

easily create/combine/apply moving averages moving_average() (much more general than stats::filter()) and study their properties: plot coefficients (plot coef()), gain (plot gain()), phase-shift (plot_phase()) and different statics (diagnostic_matrix())

rjdfilters (1)

easily create/combine/apply moving averages moving_average()
(much more general than stats::filter()) and study their properties:
plot coefficients (plot_coef()), gain (plot_gain()), phase-shift
(plot_phase()) and different statics (diagnostic_matrix())

- trend-cycle extraction with different methods to treat endpoints:
- lp_filter() local polynomial filters of Proietti and Luati (2008) (including Musgrave): Henderson, Uniform, biweight, Trapezoidal, Triweight, Tricube, "Gaussian", Triangular, Parabolic (= Epanechnikov)
- rkhs_filter() Reproducing Kernel Hilbert Space (RKHS) of Dagum and Bianconcini (2008) with same kernels
- fst_filter() FST approach of Grun-Rehomme, Guggemos, and Ladiray (2018)
- o dfa_filter() derivation of AST approach of Wildi and McElroy (2019)

rjdfilters (1)

easily create/combine/apply moving averages moving_average() (much more general than stats::filter()) and study their properties: plot coefficients (plot coef()), gain (plot gain()), phase-shift (plot_phase()) and different statics (diagnostic_matrix())

• trend-cycle extraction with different methods to treat endpoints:

- lp filter() local polynomial filters of Proietti and Luati (2008) (including Musgrave): Henderson, Uniform, biweight, Trapezoidal, Triweight, Tricube, "Gaussian", Triangular, Parabolic (= Epanechnikov)
- rkhs filter() Reproducing Kernel Hilbert Space (RKHS) of Dagum and Bianconcini (2008) with same kernels
- fst filter() FST approach of Grun-Rehomme, Guggemos, and Ladiray (2018)
- o dfa_filter() derivation of AST approach of Wildi and McElrov (2019)
- change the filter used in X-11 for TC extraction

Create moving average moving_average() (1)

```
(Recall: B^i X_t = X_{t-p} and F^i X_t = X_{t+p})
library(rjdfilters)
m1 = moving_average(rep(1,3), lags = 1); m1 # Forward MA
## [1] " F + F<sup>2</sup> + F<sup>3</sup>"
m2 = moving_average(rep(1,3), lags = -1); m2 # centered MA
## [1] " B + 1,0000 + F"
m1 + m2
## [1] " B + 1,0000 + 2,0000 F + F<sup>2</sup> + F<sup>3</sup>"
m1 - m2
## [1] " - B - 1,0000 + F<sup>2</sup> + F<sup>3</sup>"
m1 * m2
## [1] "1,0000 + 2,0000 F + 3,0000 F^2 + 2,0000 F^3 + F^4"
```

Create moving average moving_average() (2)

```
Can be used to create all the MA of X-11.
e1 \leftarrow moving average(rep(1,12), lags = -6)
e1 <- e1/sum(e1)
e2 \leftarrow moving\_average(rep(1/12, 12), lags = -5)
# used to have the 1rst estimate of the trend
tc 1 \leftarrow M2X12 \leftarrow (e1 + e2)/2
coef(M2X12) |> round(3)
## t-6 t-5 t-4 t-3 t-2 t-1 t t+1 t+2 t+3
## 0.042 0.083 0.083 0.083 0.083 0.083 0.083 0.083 0.083 0.083
## t+4 t+5 t+6
## 0.083 0.083 0.042
si 1 <- 1 - tc 1
M3 \leftarrow moving\_average(rep(1/3, 3), lags = -1)
M3X3 <- M3 * M3
# M3X3 moving average applied to each month
coef(M3X3) |> round(3)
## t-2 t-1 t t+1 t+2
```

0.111 0.222 0.333 0.222 0.111

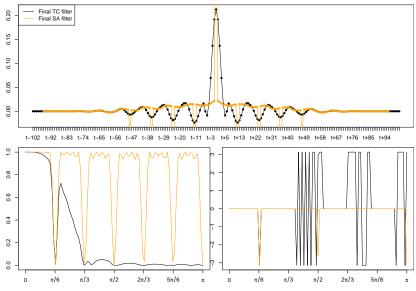

Create moving average moving_average() (3)

```
M3X3 seasonal <- to seasonal (M3X3, 12)
coef(M3X3 seasonal) |> round(3)
## t-24 t-23 t-22 t-21 t-20 t-19 t-18 t-17 t-16 t-15

```

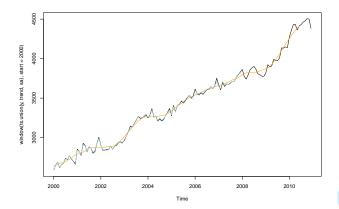

Create moving average moving_average() (4)

Create moving average moving_average() (5)

Create moving average moving_average() (6)

Apply a moving average

rjd3sts

Interface to structural time series and state space models

 $Several\ examples\ available\ here\ https://github.com/palatej/test_rjd3sts$

rjd3bench

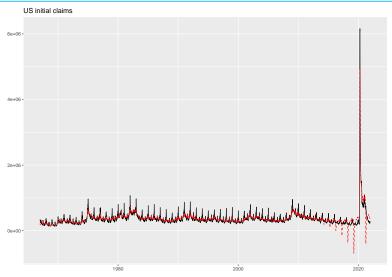

Benchmarking and temporal disaggregation

Several examples here: https://github.com/palatej/test_rjd3bench

ggdemetra3 (1)

Like ggdemetra but compatible with rjdemetra3: ggplot2 to add seasonal adjustment statistics to your plot. Also compatible with high-frequency methods ("x11-extended", "fractionalairline", "multiairline" or "stl"):

ggdemetra3 (2)

Contents

- 1. Introduction
- 2. Utility packages
- 3. Seasonal adjustment packages
- 4. Other packages
- 5. Conclusion

Conclusion

With JDemetra+ 3.0, lots of new **Q** packages are coming:

- On time series analysis and seasonal adjustment (much faster than standard packages)
- New developments on seasonal adjustment will be available (e.g. high-frequency data)
- Allow to create new trainings thanks to a deeper acces to all the functionalities of JDemetra+

Conclusion

With JDemetra+ 3.0, lots of new **Q** packages are coming:

- On time series analysis and seasonal adjustment (much faster than standard packages)
- New developments on seasonal adjustment will be available (e.g. high-frequency data)
- Allow to create new trainings thanks to a deeper acces to all the functionalities of JDemetra+

Many ways to contribute:

- Testing it and reporting issues
- Developping new tools (other packages, new functions, etc.)

Thank you for your attention
