Purpose of the RJDemetra package

RJDemetra is an **Q** interface to JDemetra+ based on the **\equiv** libraries of JDemetra+

- Complete R package for Tramo-Seats and X13
- Users: "pure R" package
 - Part of R routines, automatization
 - Batch processing
 - · E.g.: direct vs indirect aggregates adjustment, dashboards
 - Usage of other R functions and packages
- JD+ functionality
 - Modeling and seasonal adjustment
 - Full specification
- Advanced graphical presentation: JD+

Current status

- RegARIMA, TRAMO-SEATS and X-13-ARIMA:
 - pre-defined and user-defined specifications
 - S3 classes with plot, summary, print methods
- ightarrow Programing-choice: not manipulate the Java object and use S3 classes (more simple)

\pause

- Manipulate JD+ workspaces:
 - Import JD+ workspace to get input raw series or SA model
 - Export R models created via RJDemetra
- Include a dataset: industrial production indices in manufacturing in the European Union

RegARIMA examples (1/3)

```
library(RJDemetra)
ipi fr <- ipi c eu[,"FR"]</pre>
regarima model <- regarima x13(ipi fr, spec = "RG4c")
regarima model
## y = regression model + arima (2, 1, 1, 0, 1, 1)
## Log-transformation: no
## Coefficients:
##
           Estimate Std. Error
## Phi(1) 0.3358
                        0.171
## Phi(2) 0.2060 0.096
## Theta(1) -0.2450 0.173
## BTheta(1) -0.5112 0.050
##
##
              Estimate Std. Error
## Easter [1] -1.133 0.337
## LS (11-2008) -8.000
                           1.283
## LS (1-2009) -7.551
                           1.283
```

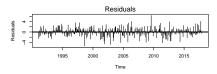

RegARIMA examples (2/3)

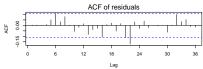

summary(regarima_model)

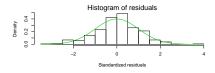

```
## y = regression model + arima (2, 1, 1, 0, 1, 1)
##
## Model: RegARIMA - X13
## Estimation span: from 1-1990 to 12-2017
## Log-transformation: no
## Regression model: no mean, no trading days effect, no leap year effect, Easte
##
## Coefficients:
## ARTMA:
##
           Estimate Std. Error T-stat Pr(>|t|)
## Phi(1) 0.33579 0.17106 1.963 0.0505.
## Phi(2) 0.20600 0.09643 2.136 0.0334 *
## Theta(1) -0.24498 0.17272 -1.418 0.1571
## ---
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1
##
## Regression model:
##
              Estimate Std. Error T-stat Pr(>|t|)
## Easter [1] -1.1332
                         0.3373 -3.359 0.000875 ***
## LS (11-2008) -7.9997
                         1.2831 -6.235 1.42e-09 ***
```

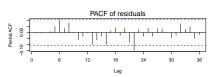

RegARIMA examples (3/3)

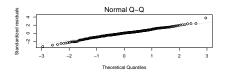

layout(matrix(1:6, 3, 2));plot(regarima_model, ask = FALSE)

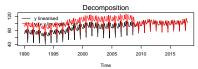

Seasonal adjustment examples (1/9)

A SA object is a list() of 5 elements:

```
Fregarima (* X-13 and TRAMO-SEAT)

| specification
| ...
| decomposition (* X-13 and TRAMO-SEAT)
| specification
| ...
| final
| series
| forecasts
| diagnostics
| variance_decomposition
| combined_test
| ...
| user_defined
```

Seasonal adjustment examples (2/9)

Like in ${\sf JD}+$ users can defined their own specification or use a pre-defined one:

Seasonal adjustment examples (3/9): decomposition

x13_mod\$decomposition

```
##
   Monitoring and Quality Assessment Statistics:
##
        M stats
## M(1)
          0.055
## M(2) 0.041
## M(3) 0.926
## M(4) 0.621
## M(5) 0.724
## M(6) 0.215
## M(7) 0.074
## M(8) 0.208
## M(9) 0.056

```

Import a workspace (2/4)

Import a workspace (3/4)

```
compute(wk) # Important to get the Sa model
models <- get_model(wk) # A progress bar is printed by default
  Multiprocessing 1 on 1:
##
                                                                              0%
                                                                             50%
# To extract only one model
mp <- get_object(wk, 1)</pre>
count (mp)
## [1] 2
sa2 <- get_object(mp,2)</pre>
get_name(sa2)
```

[1] "SA with TramoSeats model 1"

mod <- get_model(wk, sa2)</pre>

Import a workspace (4/4)

Known issues:

- Import may be incomplete: models with Ramp effects, IV, benchmarking... partially imported: correct results but changing the spec will erase them
- \rightarrow Someone has a **R** function to create IV?
 - "X11" spec not implemented: will not be imported ightarrow needed?
- Error when there is "metadata" (comments, etc.): https://github.com/jdemetra/rjdemetra/issues/53

Sommaire

- 1. RJDemetra
- 2. Manipulate workspaces
- 3. Reduce time computation
- 3.1 Manipulate Java objects
- 3.2 Benchmarking
- 4. Installation and future developments
- 5. Around RJDemetra

Manipulate \leq objects (1/2)

Default functions can be time consuming (computation of outputs)... Especially if you only need one specific parameter

 \rightarrow "Manipulate" java models: jx13, jtramoseats, jregarima, jregarima_x13, jregarima_tramoseats and get_jmodel

```
jx13_mod <- jx13(ipi_fr, x13_usr_spec)
# To get the available outputs:
tail(get_dictionary(jx13_mod))</pre>
```

```
## [1] "diagnostics.td-res-all" "diagnostics.td-res-last"
## [3] "diagnostics.ic-ratio-henderson" "diagnostics.ic-ratio"
```

[5] "diagnostics.msr-global" "diagnostics.msr(*)"

Manipulate \leq objects (2/2)

```
# To get an indicator:
get_indicators(jx13_mod, "diagnostics.td-res-all", "diagnostics.ic-ratio")

## $`diagnostics.td-res-all`
## [1] 3.020374254 0.006933563

## attr(,"description")
## [1] "F with 6 degrees of freedom in the nominator and 317 degrees of freedom
##
# $`diagnostics.ic-ratio`
## [1] 4.356533

# To get the previous R output
x13_mod <- j$A2R(jx13_mod)</pre>
```

→ The output can be customize by every user/institute

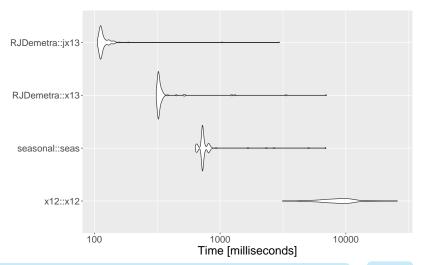

No error returned by jx13() with "wrong" SA (preliminary check...) and get_indicators() returns NULL objects

add_sa_item not compatible with jSA objects

Bencharking with X-13 on French IPI

R version 3.5.3 (2019-03-11), x86_64-w64-mingw32, Windows 7 x64 (build 7601) Service Pack 1

Sommaire

- 1. RJDemetra
- 2. Manipulate workspaces
- 3. Reduce time computation
- 4. Installation and future developments
- 4.1 How to install the package?
- 4.2 Future developments
- 5. Around RJDemetra

How to install the package?

The package is available on \square : https://github.com/jdemetra/rjdemetra

It has also it's own website: https://jdemetra.github.io/rjdemetra/

```
# Cran release
install.packages("RJDemetra")

# Development version
devtools::install_github("jdemetra/rjdemetra")
```

To install it you need Java8: in case you don't, install a portable version of Java8 and set the JAVA_HOME path.

See the installation manual:

https://github.com/jdemetra/rjdemetra/wiki/Installation-manual

What's next?

- Vignette/article for the Journal of Statistical Software. Work in progress: https://github.com/AQLT/vignette_rjdemetra
- Cheat sheet
- Benchmarking?
- Function to "refresh" the model (JD+ 3.0.0)

Sommaire

- RJDemetra
- 2. Manipulate workspaces
- 3. Reduce time computation
- 4. Installation and future developments
- 5. Around RJDemetra

Examples of current use of RJDemetra

- rjdqa: package to help quality assessment (dashboard and quality report matrix)
- https://github.com/AQLT/rjdqa
 - persephone: enable easy processing during production of SA series (interactive plots, dashboards...)
- https://github.com/statistikat/persephone
 - ggdemetra: ggplot2 extension for 'RJDemetra'
- https://github.com/AQLT/rjdqa
 - Carry out studies on SA: Ladiray D., Quartier-la-Tente A., "(In)Stability of Reg-ARIMA Models for Seasonal Adjustment"
 - Non explore topics: we will see after the hackathon

Ideas for the hackathon

- Export/import specifications as a data.frame
- RJDemetran and chain-linking (KIX)
- Revision Analysis
- Tool for direct/indirect adjustment
- Shiny app for interactively changing specification
- Automatic report of a model/workspace: PDF, markdown (html, docx...)
- Additional features importing/exporting workpaces: handle error when there are comments, get metadata (and set?), import of intervention variables/Ramp effect

Thank you for your attention
